Ø=Ý Answer Key Grade Levels: 4 Total Questions: 1 Answer 1 Correct

Plants, like the tulsi plant, need water to live and grow. Water helps them stand upright, transport food, and stay healthy. If a plant doesn't get water for many days, it cannot perform these important functions. Its leaves will start to lose their firmness, droop, change color (like yellow or brown), and eventually, the plant will dry up and die because it cannot survive without water.
